Lab 8 - Concrete Classes and Abstract Classes

Objective

- To develop an inheritance hierarchy of classes that model different types employees in a company. This lab will provide additional experience developing superclasses and subclasses, using a more open-ended problem than previous labs that dealt with inheritance.

Attendance/Demo

To receive credit for this lab, you must demonstrate your work. **Also, you must submit your lab work to cuLearn.** (Instructions are provided in the *Wrap Up* section at the end of this handout.)

When you have finished all the exercises, call a TA, who will grade the code you wrote. For those who don't finish early, a TA will ask you to demonstrate whatever code you've completed, starting about 30 minutes before the end of the lab period. **Any unfinished exercises should be treated as "homework"; complete these on your own time, before Lab 8.**

References

Objects First with Java, Chapters 8, 9 and 10.

Getting Started

Step 1: Create a new folder named Lab 8.

Step 2: Download company.zip to your Lab 8 folder.

Step 3: Extract the *company* project from the zip file into a project folder named *company*.

Step 4: Open the *company* folder. Double-click on the BlueJ project file, which is named *package*. This will launch BlueJ and open the *company* project.

Background - Modelling Employees

A company has two kinds of employees. *Salaried employees* have a name, an ID number and an annual salary; for example, Cathy Coder has ID 123456 and earns \$60,000 per year. *Hourly employees* have a name, an ID number and are paid an hourly wage. For example, Harry Hacker has ID 111222 and works 15 hours a week for \$20.00 per hour (so he earns \$300 per week).

Exercise 1

Step 1: The project contains incomplete implementations of classes named *Employee*, *SalariedEmployee* and *HourlyEmployee*. Your task is to complete the design and

implementation of the classes, subject to the following constraints. **Remember to avoid smelly code; for example, unnecessary code duplication.**

- The `SalariedEmployee` and `HourlyEmployee` classes must be subclasses of the abstract `Employee` class.
- It's up to you to decide what fields are needed by `SalariedEmployee` objects and `HourlyEmployee` objects. Some of the fields should be declared in the superclass, `Employee`, and some of the fields should be declared in the subclasses. Use the knowledge of class inheritance that you've gained over the past three labs to help you decide where each field should be defined. **The visibility of all of the fields must be `private`.**
- `SalariedEmployee` and `HourlyEmployee` must each have a two-parameter constructor that is passed the employee's name and ID number.
 - When an instance of class `SalariedEmployee` is created, the employee's name and ID must be initialized to the specified values, and any other fields in the object must be initialized to 0.
 - Similarly, when an instance of class `HourlyEmployee` is created, the employee's name and ID must be initialized to the specified values, and any other fields in the object must be initialized to 0.
- Abstract class `Employee` currently declares three abstract methods: `calculatePay`, `hasSameID`, and `toString`. For each of the three methods, you have to decide:
 - Should the method in `Employee` remain abstract, and be implemented as a concrete method in `SalariedEmployee` and `HourlyEmployee`?
 - Should the method in `Employee` be changed to a concrete method and implemented in `Employee`, and inherited by `SalariedEmployee` and `HourlyEmployee`? (Remember that to change an abstract method to a concrete method, you must delete `abstract` from the method header, and replace the terminating `;` with a complete method body.)
 - Should the method in `Employee` be changed to a concrete method and implemented in `Employee`, and overridden in `SalariedEmployee` and `HourlyEmployee`?

- In addition to the methods declared in `Employee`, you must be able to call the following method on `SalariedEmployee` objects:

```
/**
 * Set this employee's annual salary to the
 * specified amount.
 */
public void setAnnualSalary(double salary)
```

- In addition to the methods declared in `Employee`, you must be able to call the following methods on `HourlyEmployee` objects:

```
/**
 * Sets this employee's hourly wage to the specified wage.
 *
 * @param wage the amount this employee earns in one hour.
 */
public void setHourlyWage(double wage)

/**
 * Sets the number of hours this employee works in
 * one week.
 *
 * @param hours the hours this employee works each week.
 */
public void setHoursWorked(double hours)
```

- You are not permitted to define any accessor (getter) methods in the `Employee`, `SalariedEmployee` and `HourlyEmployee` classes to retrieve an employee's name, ID, annual salary, hours worked or hourly wage.

Step 2: Create a few different `SalariedEmployee` and `HourlyEmployee` objects and place them on the object bench. Interactively test these objects.

Step 3: Run the unit tests in `SalariedEmployeeTest` and `HourlyEmployeeTest` and correct any bugs.

Exercise 2

Step 1: Read the Javadoc comments for class `Company` and finish the implementation of the class. This class must use **one** `ArrayList` object to store **all** the company's employees. Notice that the `lookupEmployee` and `addEmployee` methods both have a parameter of type `Employee`. This parameter is a *polymorphic* variable: it can contain a reference to an instance of `SalariedEmployee` or an instance of `HourlyEmployee`, because those classes are subclasses of `Employee`. This means that we can pass references to `SalariedEmployee` objects and `HourlyEmployee` objects to `lookupEmployee` and `addEmployee`.

When defining the `lookupEmployee`, `addEmployee` and `calculatePayroll` methods, you

are not permitted to call `getClass` or use Java's `instanceof` operator to determine if an employee is a salaried employee or an hourly employee.

Step 2: Run the unit tests in `CompanyTest` and correct any bugs.

Wrap-Up

1. With one of the TAs watching, run the JUnit tests in `SalariedEmployeeTest`, `HourlyEmployeeTest` and `CompanyTest`. The TA will note how many test cases pass. The TA will review your solutions to the exercises, assign a grade (Satisfactory, Marginal or Unsatisfactory) and have you initial the demo/sign-out sheet.
2. The next thing you'll do is package the project in a *jar* (Java archive) file named `company.jar`. To do this:
 - 2.1. From the menu bar, select **Project > Create Jar File...** A dialog box will appear. Click the **Include source** and **Include BlueJ project files** check boxes. A check-mark should appear in each box. Do not modify the **Main class** field.
 - 2.2. Click **Continue**. A dialog box will appear, asking you to specify the name for the jar file. Type **company** or select the BlueJ icon named **company** in the list of files. **Do not use any other name for your jar file** (e.g., `lab8`, `my_project`, etc.).
 - 2.3. Click **Create**. BlueJ will create a file named **company** that has extension **.jar**. (Note: you don't type this extension when you specify the filename in Step 2.2; instead, it's automatically appended when the jar file is created.) The jar file will contain copies of the Java source code and several other files associated with the project. (The original files in your **company** folder will not be removed).
3. Before you leave the lab, log in to cuLearn and submit `company.jar`. To do this:
 - 3.1. Click the **Submit Lab 8** link. A page containing instructions and your submission status will be displayed. After you've read the instructions, click the **Add submission** button. A page containing a **File submissions** box will appear. Drag `company.jar` to the **File submissions** box. Do not submit another type of file (e.g., a `.java` file, a RAR file, a `.txt` file, etc.)
 - 3.2. After the icon for the file appears in the box, click the **Save changes** button. At this point, the submission status of your file is **"Draft (not submitted)"**. If you're ready to finish submitting the file, jump to Step 3.4. If you instead want to replace or delete your "draft" file submission, follow the instructions in Step 3.3.
 - 3.3. You can replace or delete the file by clicking the **Edit my submission** button. The page containing the **File submissions** box will appear.
 - 3.3.1. To overwrite a file you previously submitted with a file having the same name, drag another copy of the file to the **File submissions** box, then click the **Overwrite** button when you are told the file exists ("There is

already a file called..."). After the icon for the file reappears in the box, click the **Save changes** button.

- 3.3.2. To delete a file you previously submitted, click its icon. A dialogue box will appear. Click the **Delete** button., then click the **OK** button when you are asked, "**Are you sure you want to delete this file?**" After the icon for the file disappears, click the **Save changes** button.
- 3.4. Once you're sure that you don't want to make any changes to the project you're submitting, click the **Submit assignment** button. A **Submit assignment** page will be displayed containing the message, "**Are you sure you want to submit your work for grading? You will not be able to make any more changes.**" Click the **Continue** button to confirm that you are ready to submit your lab work. This will change the submission status to "**Submitted for grading**".
